Abstract (en)
[origin: WO2008107487A1] The invention relates to a lifting-sliding door (1), which comprises at least one horizontally movable leaf (2) and a frame (4) with at least one slide rail, wherein means are provided, which when the movable leaf is lowered bring about a fixation of the movable wing in a direction perpendicular to the wing plane. These means are rigidly connected to the movable leaf. Leaf positioners (16, 16') are used as means for fixing the movable leaf, the positioners having a substantially U-shaped recess that is open in the direction of the slide rail, so that the leaf positioner surrounds the slide rail on both sides at least in partial regions when the movable leaf is in the lowered position.
