Abstract (en)  
[origin: WO2008122813A1] Apparatus for holding a disk comprising a holding portion in the form of a tray formed from a sheet of resilient material by vacuum or pressure moulding and having overlapping portions for overlapping the upper surface of the disk at the periphery thereof, the periphery of a disk being receivable beneath the overlapping portions to inhibit removal of the disk from the apparatus in a direction perpendicular to the plane of the disk, and the disk being disengageable from said overlapping portions by sliding the disk in a direction parallel to the plane of the disk. The holding portion is mounted to a cover member formed from sheet material. The edges of the cover member may be folded around flanges of the holding portion or its cut edges may be colour-matched with adjoining areas.
