Abstract (en)

[origin: EP2133496A2] The door grip has a blocking member (10) serving as a mass blockage, and arranged in an ineffective disengagement position and operates a handle. The blocking member passes in case of a crash into an effective blocking position and blocks the handle. Magnet or damping device (20) is provided for maintaining the blocking member in the blocking position in case of a crash, until the oscillations caused by the crash and acting on the outside door grip and/or the handle have decayed so far that an actuation of the handle is not performed by the oscillations.
