Abstract (en)

[origin: WO2008107491A1] The invention relates to a knife, particularly for cutting food, comprising a blade that is disposed to be rotatable about an axis of rotation and performs a rotational movement about the axis of rotation during operation of the knife, and a spacer which is arranged on a stationary section of the knife, at a distance from the blade, in order to define a measure for the depth during the cutting process. According to the invention, the spacer (2) is connected to the stationary section (4) of the knife (1) by means of an adjusting device (24) which allows the spacer (2) to be adjusted relative to the blade (3) in the direction of the axis of rotation (A), the spacer (2) being retained on the stationary section (4) of the knife (1) by means of the adjusting device (24). As a result, the spacer of the disclosed knife is better connected and is easier to adjust.
