Abstract (en)
[origin: WO2008122275A1] The invention relates to a multiple-cavity mold for sequentially producing a one-piece "continuous element" from successively arranged, identical cast parts, consisting of at least two individual female molds that are complementary to the cast part and that are interlinked by respective runners to form respective fillets. A second, identical runner is joined to one of the two outer individual female molds, the respective junction and the respective direction of the two runners for both outer individual female molds being identical. The second runner is open at least to the side opposite its point of placement and its open end can be closed by a closure.
