Abstract (en)

[origin: WO2009074237A2] The invention relates to a temple cylinder 1, particularly for a weaving machine, comprising at least one carrier element 6, which is disposed between a closing head 3 and an end piece 4 and on which at least one wheel 7 acting on a fabric web is supported protected from displacement. For the simplified removal of an individual wheel or individual carrier elements with wheels from the temple cylinder, according to the invention there is the possibility that each carrier element comprises a first support point that is inclined relative to the longitudinal axis L-L of the temple cylinder 1 for an individual wheel and a second support point disposed at a distance thereto for attachment to a support body and for removal from the support body 14 extending along the temple cylinder 1.
