Abstract (en)
[origin: WO2008110285A1] Carriers are an up-and-coming target family with enormous potential and offer commercial and scientific possibilities. The sodium/calcium exchanger is an important mechanism for the removal of Ca^{2+} from various cells. In the heart, said sodium/calcium exchanger extrudes Ca^{2+} , which has entered through Ca^{2+} channels for the initiation of contractions, while Na^{+} enters the heart cell. It is of considerable interest to identify compounds that modulate the activity of the sodium-calcium exchanger. The present invention relates to a fluorescence-based assay for the detection of compounds for modulating the NCX in "forward mode." The invention further relates to a parts set comprising cells that express NCX and to the use of said parts set for testing a compound for activity as an agonist or antagonist of NCX.
