Abstract (en

[origin: WO2008122401A1] The invention relates to a cable comprising a cable inner body in which at least one conductor strand of an optical and/or electric conductor extends in the longitudinal direction of the cable, a cable cover surrounding the cable inner body and which lies between the outer surface of the cable and the cable inner body, and at least one information carrier unit that is arranged inside the outer surface of the cable. The aim of the invention is to improve said cable by providing information on the cable. This is achieved in such a manner that the at least one information carrier unit can be read by electromagnetic field coupling, that the at least one information carrier unit detects at least one measurement value of a sensor that is associated therewith and that said measurement value can be read by a reading device.
