Abstract (en)  
[origin: WO2008122389A1] The invention relates to a cable comprising a cable inner body in which at least one conductor strand of an optical and/or electric conductor extends in the longitudinal direction of the cable, a cable cover surrounding the cable inner body and which lies between the outer surface of the cable and the cable inner body, and at least one information carrier unit that is arranged inside the outer surface of the cable. The aim of the invention is to improve said cable such that the information carrier unit is arranged in the cable in a reliable manner, on suitable points and is simple to produce. According to the invention, a carrier strand extending over its length is associated with the cable inner body such that at least one information carrier unit that can be read by electromagnetic field coupling is arranged on said carrier strand and that the carrier strand is covered by the cable cover.
