Abstract (en)

[origin: CA2683878A1] Diagnostic and prognostic assistance device for physiopathological tissue changes. It comprises a coherent light source (13) for emitting coherent light along a first direction (X), for the purpose of illuminating a biological tissue (16) in first and second areas thereof, the first area being sound and the second area liable to include changes, the tissue thus illuminated generating a speckle phenomenon, means (14) for observing the speckle field in a second direction (Y) and for acquiring the speckle, and means (18) for varying the angle between the first and second directions, in order to observe the speckle field at different angles, so as to acquire information about the tissue at various depths in this tissue.
