Abstract (en)

[origin: WO2008109969A1] Method for production of a visible wall part (4) comprising panels (1) which are made at least partly from synthetic foam. The foam panels (1) have a front side, a peripheral edge, and along the peripheral edge on the front of the panels a chamfered edge zone (3) with a width (B) of at least 20 mm. The wall part (4) is formed by attaching the panels (1) made of synthetic foam in at least two rows adjoining each other such that where the panels (1) abut each other, the chamfered edge zones (3) of the panels (1) form a groove (7). To ensure a seamless transition between the foam panels (1), the groove (7) is filled with a jointing compound (9). Preferably this jointing compound (9) is skimmed off and after hardening sanded flat. To prevent cracking between the panels (1), first a reinforcement mesh (8) is arranged in the groove (7) such that this mesh (8) covers at least partly the two adjacent edge zones (3).
