Abstract (en)

[origin: WO2008132395A1] A programming language L defined by a grammar GL is identified for a digital document to be protected constituting a source code; an action-based grammar module is associated with said programming language L; a structural characterization of the code is carried out in a single syntactic analysis pass on the basis of the action-based grammar module; to do this, a grammar dictionary GDL is constructed, associated with the programming language and comprising a set of structural terms such that each of these terms is associated with a rule or a set of rules, and the source code is transformed into a structural sequence (RL/ TL, GDJ comprising the set of structural terms and the grammar dictionary GDL of the language L; the transformation of a digital document to be analysed into a structural sequence (RL, TL/ GDL) is carried out in the same manner and the degree of plagiarism between the source code of the digital document to be protected and the source code of the digital document to be analysed is measured with the aid of a quantification of the degree of alignment between the respective structural sequences of the source codes of the digital document to be protected and of the digital document to be analysed.
