Abstract (en)

[origin: EP2138310A2] The system has multiple units for producing a relative movement between a product e.g. envelope, and an ink print head, which is a part of an ink cartridge (11). An ink cartridge receptacle for receiving the ink cartridge is provided with a shaft-like cavity. A guiding pin is fixed at the ink cartridge. A wall of the ink cartridge limits the cavity and includes a guide slotted piece. A carrier (126) of the receptacle includes a stop (12641) and another stop, which limit tilting of the ink cartridge during replacement. The fixation of the pin takes place by a force and/or form-fit connection.
