Abstract (en)

[origin: EP2138406A1] The method involves covering cross bottom with a bottom cover sheet (18). The bottom cover sheet is drawn off from a narrow sidewall and from part of adjoining bottom flaps (12). One of the bottom flaps is torn on a far side of the corner tuck in order to separate a part (12') of the bottom flaps with respect to free edges. The separated parts are bent together with a corner tuck by being folded up about the folding lines (13) via which emptying of the bag contents takes place into a pour-out channel. An independent claim is also included for a bag including a material ply formed into a closed tube.
