Abstract (en)
[origin: EP2139073A1] Electrical connection bridge (10) comprising two interconnected pins (16) and two insulating sleeves (11, 13) which respectively surround the two pins (16), such that one of said sleeves (11) is provided at its front end with at least one flange portion (12) to prevent the exit of said sleeve from its housing in a connection block (20). When said connection bridge (10) is mounted in a connection block (20), then, once the flanged sleeve (11) has been introduced in its housing, the flange (12) allows the flanged sleeve to rotate and slide but prevents it to be extracted from said housing. The connection bridge provides a bridging with another adjacent connection block, whereby the connection bridge is usually transversal and is incorporated in the first connection block.
