Abstract (en)
[origin: CA2673740A1] The invention relates to a roller device (1) comprising at least two rollers, each roller being mounted by means of roll chocks (2) in a roll stand (3), wherein the rollers are provided with axial displacement means (4) for an axial displacement in a displacement direction (x), by means of which the rollers may be placed and held in a desired position relative to the roll stand (3), and wherein the rollers are in an operative connection with bending means (5), by means of which a bending momentum may be exerted on said rollers. In order to keep the losses of bending force as a result of the weight of the axial displacement means as low as possible, the invention provides for the axial displacement means (4) to be disposed with a first operative end (6) directly or indirectly on the roll stand (3) by means of an articulated connection (9) on the roll chock (2).
