Abstract (en)

[origin: WO2008116653A1] The invention relates to a method for filling and sealing a bag, according to which the following steps are carried out: a bag (8) is filled by a filling element (2); the filling element and the bag move in relation to each other while the bag is being filled; parts of the filling element (2) are at least temporarily immersed below the level of the filling product (38) during a first phase (P_u) during the filling of the bag. The weighing cells (26) supply measuring signals at least during a second phase (P_M) comprising at least parts of the first phase (P_u). Said signals are used by the control device for controlling and/or regulating the filling process.
