Abstract (en)

[origin: WO2008115075A1] The present invention relates to a device for joining two building elements (1, 2), for example a column and a beam, which device comprises a first element (3) secured to one of the building elements (1, 2) and adapted for cooperation with a bridge element (5) which in a working position is in contact with both the first and second building element (1, 2), connecting the building elements (1, 2). The first element (3) is embedded in the building element (1, 2) with an elastic sleeve (10) arranged between the first element (3) and the building element (1, 2), where the elastic sleeve (10) is provided with at least one internal groove (17), thereby forming at least one cavity between the elastic sleeve (10) and the first element (3). The invention also relates to a device where the bridge element (5) is provided with a corresponding elastic sleeve (10), and the use of an elastic sleeve.
