Abstract (en)
[origin: EP2141287A1] The method involves washing a rear side of load distribution-cavities (8), and arranging wall holes (9, 10) in the load distribution-cavities through a retaining wall (1). A load distribution unit is formed in the load distribution-cavities by filling with mortar. The load distribution unit is anchored by a base anchor (5), and anchor rods are inserted into the wall holes. Ends of the anchor rods are anchored to the load distribution unit, where the ends passes into the load distribution-cavities, and the wall holes are injected with the mortar.
