Abstract (en)

[origin: EP2141294A2] The valve (1) has a bracket (7) defining a catch, on which an overflow pipe (3) rests in a raised position, assigned to a complete flushing by a projection (3.2) in the overflow pipe. The bracket has a lever (8) which is actuated for withdrawing the projection, where the projection seats on the catch in the position assigned to the complete flushing. A lower float (6) i.e. control float, is rotatably supported by the bracket. The lever is rotatably supported at the bracket and connectable with the lower float such that the lever is actuated by the lower float.
