Abstract (en)
[origin: EP2141318A1] The invention relates to an improved window, which is preferably round, formed by lower profile (2a) and upper profile (2b), with symmetrical attachment parts (6) and elements (7) holding and hinging the sheet (3) configured by solid L-shaped frame (4). The lower profile (2a), in an inverted T-shape, has asymmetrical transverse branches (9) and (10) for the inner part, and the end of the perpendicular branch (11) is reduced, with rabbets (12) for the profiles (13) emerging from the attachment parts (6). The upper profile (2b) has a perpendicular branch (14) with rabbets (15) for the profiles (13), and a long outer section (16) at the inner part of the closure, whereas the end (17) of the perpendicular section (14) is bent towards the inside of the window, embracing the frame (4), said end (17) being the widest externally visible area of the sash (2) of the window (1).
