Abstract (en)

[origin: EP2451086A1] The invention concerns a method for assigning precoding vectors in a mobile cellular network as well as a base station (21). A base station (21) provides a code book comprising indexed precoding vectors to one or more mobile stations (41, 42, 43) associated with the base station (21) via a downlink channel (1001, 2001, 3001). A mobile station (41, 42, 43) associated with the base station (21) selects one or more indices of preferred precoding vectors from the code book and reports the indices of the one or more preferred precoding vectors to the base station (21) via an uplink channel (1002, 2002, 3002). The mobile station (41, 42, 43) selects one or more indices of preferred companion precoding vectors from the code book, which are precoding vectors that shall preferably be used by the base station (21) for other mobile stations served by the base station (21) on the same time/frequency resource, and reports the one or more indices associated with the preferred companion precoding vectors to the base station (21) via the uplink channel (1002, 2002, 3002). For each mobile station associated with the base station (21), the base station (21) determines a precoding vector based on the reported one or more indices of the preferred precoding vectors and based on the reported one or more indices of the preferred companion precoding vectors.
