Abstract (en)

[origin: WO2008121350A2] In a particular embodiment, a system (104) is disclosed to search one or more data sources (108, 132, 134, 136, 238, and 140). The system (104) includes an interface (112) to a network (106) and a visualization system (128, 370) to provide a search interface (2608) to a destination device (102) via the network (106). The system (104) further includes a search system (122) to communicate with the interface (112) to receive a query from the destination device (102). The search system (122) is adapted to proxy the query to search multiple data sources (108, 132, 134, 136, 238, and 140), to receive search results from the multiple data sources, and to extract data from the search results. The system (104) also includes a personalization system (368) adapted to personalize the search results from the multiple data sources to a particular user. The personalization system (368) provides a personalized user interface to the destination device (102) based on the extracted data and based on data associated with the particular user.
