Abstract (en)
[origin: CA2684527A1] The invention relates to an installation switching device having an insulation housing with a front side and an attachment side which are connected by means of two wide sides and one narrow input side and one narrow output side, and having a current path running between an input terminal and an output terminal. The current path can be switched on and/or off via a main contact point which can be open or closed for long periods of time by means of a switching mechanism operated by a switch grip. The invention is characterized in that a phase terminal bar can be arranged in the interior of the housing near the attachment side and running roughly parallel thereto, can be connected to the connection terminal near the narrow input side in the installed position, and is electrically and mechanically insulated from the other components and units inside the housing. A clamp contact is attached to the free end of the phase terminal bar and projects out of the housing on the attachment side, for clamping to current bars in an installation distributor.
