Abstract (en)  
[origin: WO2008122256A1] The invention relates to the field of spatial representation, particularly to images which are spatially perceivable for simultaneous multiple viewers without auxiliary devices so-called autostereoscopic visualization. The invention addresses the problem of creating a form of autostereoscopic representation based on barrier technology in order to achieve an improved perceptibility for multiple simultaneous viewers. This problem is solved by a method for spatial representation wherein image section data of different viewpoints  $A(k)$ , where  $k=1, \dots, n$  and  $n=6$  or  $n=7$ , are made visible on a grid of image elements  $x(i,j)$ , and at least one parallax barrier screen containing alternating opaque and transparent sections is placed at a distance before or behind the grid of image elements  $x(i,j)$ . The transparent sections substantially correspond to straight bordered lines which, during the parallel projection of parallax barrier screens onto the grid of image elements  $x(i,j)$ , are inclined to at least 21 degrees with respect to the vertical direction of the grid of image elements  $x(i,j)$  and, furthermore, each have the width of at least 1.9 image elements  $x(i,j)$  in the horizontal direction of the grid of image elements  $x(i,j)$ .
