Abstract (en)

[origin: DE102008033459B3] The method involves directly filling filler into a hose-manufacturing textile machine (1) in an area of a working zone (7) such that the filler is withdrawn directly into a guide tube (4) below the working zone. The filling level of a funnel (3) is adjusted by a level regulator which controls the supply of filler via a supply and dosing device (2). A textile web formed at a textile hose (8) is supplied additionally to the filler in the area of the working zone for encasing the filler. An independent claim is also included for a textile hoses filling device comprising a supply and dosing device.
