Abstract (en)  
[origin: EP2143856A1] The device (1) has a sheating board support (6) including a U-shaped metallic section provided with rectangular cleats (12, 13), where longitudinal dimension of each cleat defines a space between a vertical face (3) of a rubble (2) and a base wall (9) of the section. A guiding and receiving unit has a spline (18) to guide a longitudinal displacement of a connection element (7) i.e. flat rod, where the spline is provided with a horizontal and rectangular portion and two lateral flaps. The unit is longitudinally projected from the wall to form a support unit for a sheating board.
