Abstract (en)
[origin: EP2143862A1] The window has fittings (12) arranged at opposite vertical sides of a wing frame (2). The wing frame and a stick frame (1) move relative to each other by actuating an actuating unit, so that the window is openable and closable. An additional fitting has a lever arm, which is pivotably supported at the stick frame by a pivoting support and is pivotable at the wing frame by another pivoting support. The lever arm is slidably supported at the wing frame along a displacement direction (V). Another actuating unit actuates the additional fitting by applying force to the latter actuating unit.
