Abstract (en)

[origin: WO2008128950A2] The present invention relates to a vehicle with variable geometry for users with deambulation problems. The vehicle according to the invention essentially comprises a frame which supports a seat for a user. The seat is connected to the frame in an oscillating way so as to maintain a degree of freedom of oscillation about an axis of reference substantially orthogonal to the direction of travel of the vehicle. The seat is also connected to the frame so that the centre of mass thereof is located in a position between said axis of reference and a supporting surface on which the vehicle rests preferably through crawler movement means.
