Abstract (en)  
[origin: WO2008120073A1] A machine (1) for the treatment of bolts of a sheet material formed in a web (2), including: at least one treatment chamber (4), means (10) for moving the web along a pre-set path within the treatment chamber; and means (11) for controlling the means for moving the web; wherein the means for moving include at least one motor-driven assembly (12), which in turn includes at least one first conveying member (14) and one second conveying member (15), which are mobile along a closed path at least in part parallel to at least one stretch of the pre-set path of the web (2), the first and second conveying members being provided with a plurality of cross members (30), oriented perpendicular to a plane containing the closed path and set at intervals apart from one another with a pre-set pitch (P), which is relatively small with respect to the length of the closed path; the first and second conveying members (14, 15) being arranged so that, in use, along the pre-set path of the web, at least one cross member (30) of the first conveying member (14) always co-operates in contact with a first face (31) of the web, and, simultaneously, at least one cross member (30) of the second conveying member (15) always co-operates in contact with a second face (32) of the web, opposite to the first.
