Abstract (en)

Particular embodiments generally relate to providing media for display to a user. In one embodiment, the media may be stored on a remote computing device. An intermediary device may be used to display the media on an output device. Even though the media may be stored on the remote computing device, the user may believe that the media is stored on the intermediary device when displaying content using the intermediary device. Representations of the media units may be received at the intermediary device. The intermediary device automatically predicts which representations of the media may be most likely to be accessed by the user. When a request to access the media units is received, if the requested media unit is stored on the intermediary device, then it can be automatically displayed using the corresponding representation of the media unit.
