Abstract (en)

[origin: EP2147789A2] The method involves performing a start-up sequence using a predetermined preset parameter that is specific to a rotary printing press and/or a print job for a color register adjustment, a cut-off compensator control, and an ink density control. The press is stopped, where copies printed during the sequence are evaluated with respect to a color register, a cut-off compensator, and an ink density, and the parameters are adjusted. Another start-up sequence is performed, where the adjusted parameters are used for printing, when defined printing press speeds are reached and/or exceeded.
