Abstract (en)

[origin: CA2687361A1] Disclosed is a method for producing a part having a relief surface. In said method, the relief surface is produced by printing a hardening relief liquid onto a blank (14) by means of a digital printing process that is controlled using electronic data processing. The electronically stored pattern (72) that corresponds to the relief surface contains relief data which is associated with two-dimensional surface elements of the relief pattern and corresponds to the amount of relief liquid to be applied to each surface element.
