Abstract (en)

[origin: WO2008145694A1] The invention relates to a method for correcting a secondary current path ( $i_2(t)$ ) of a current converter (10) disturbed by saturation, wherein measurement values ( $i(n)$ ) of the secondary current path ( $i_2(t)$ ) of the current converter (10) are acquired. The acquired measurement values ( $i(n)$ ) are checked for a malfunction due to saturation and, if a malfunction due to saturation is present, a starting time ( $t_{start}$ ) is determined, indicating the start of the saturation. The measurement values acquired after the starting time ( $t_{start}$ ) are corrected by compensating the malfunction. In order to design a method of this kind such that it can be performed with a comparably low computing effort and without the necessity of the characteristic curves for the corresponding current converter, the invention proposes that, using measurement values acquired before the starting time ( $t_{start}$ ), characteristic parameters of the secondary current path ( $i_2(t)$ ) when saturation is absent be determined and, using the characteristic parameters thus acquired, a correct path is computed for the measurement values captured after the starting time ( $t_{start}$ ). The invention further relates to an accordingly equipped electric field device.
