Abstract (en)

[origin: WO2008148417A1] The invention relates, inter alia, to a method for the operation of an arrangement with at least one energy distribution device (20), a plurality of energy production devices (30, 30'), and an energy supply network (10) to which at least one energy distribution device and the plurality of energy generation devices are connected. The invention provides that the energy generation devices and the energy distribution device be connected directly or indirectly via a communications device (70), and that the energy distribution device determine time-dependent energy loss conditions (A) as a function of the network load of the energy supply network, and that the energy generation devices be monitored to determine which ones display energy delivery conditions (L) that agree with the corresponding energy loss conditions of the energy distribution device, and in the case of agreement, that the energy from the energy generation devices with corresponding energy delivery conditions be fed into the energy supply network.
