Abstract (en)

A fastening device for furniture shelves is described comprising a box-like body (70), an L-shaped member (50) having a rack portion (56), engagement means (72) internal to the box-like body for engaging the rack portion in adjustable manner so that the space between the box-like body and the L-shaped member can receive the thickness of the shelf, and a blocking member (80) adapted to press the means of engagement and the rack portion one on the other so as to fix their mutual position. To facilitate the fastening operation to a user, the box-like body presents a cavity (73) in which the blocking member is insertable with linear movement and on whose walls is adapted to remain firmly held, the portion (84) of the blocking member inserted in the box-like body carrying itself with the sole action of insertion in abutment on the rack portion and/or the engagement means so as to make them engage mutually.
