Abstract (en)
[origin: EP2151810A2] The device has a LCD face-plate comprising a backplane electrode (E.B.), and a matrix of electrodes controlled by a line driver's electronic card (C.D.L.). An analog quenching circuit applies a voltage (V_{backplane}) to the backplane electrode for uniformly turning on all the transistors to cause erasure of an image on a thin film transistor (TFT) screen, when an electronic signal is representative of incorrect operation of the card, so that the screen is uniformly monochrome. A value of the backplane electrode voltage is equal to a reduced value (V_{g-off}) of a threshold voltage (V_{seuil}).
