Abstract (en)  
[origin: WO2009045558A2] Film-forming materials include resins and/or crosslinkers having a -Si(OR)<sub>3</sub> group. Film-forming resins can include epoxy, acrylic, polyurethane, polycarbonate, polysiloxane, polyvinyl, polyether, aminoplast, and polyester resins. A process to produce a film-forming resin includes reacting various polymers to incorporate a pendent group comprising a -Si(OR)<sub>3</sub> group. Crosslinkers for polymerizing a film-forming material include at least two functional groups reactive with a film-forming material and at least one pendent group comprising a -Si(OR)<sub>3</sub> group. Functional groups reactive with a film-forming material include isocyanate, blocked isocyanate, uretdione, epoxide, hydroxyl, carboxyl, ester, ether, carbamate, aminoalkanol, aminoalkylether, amide, or amine groups. Film-forming resins and/or crosslinkers having a -Si(OR)<sub>3</sub> group can be used in methods of producing coating compositions. Coating compositions can be used to coat a substrate, such as a metal substrate, by electrodeposition. Applied coatings containing the film-forming resins can be cured to form crosslinked films on substrates.
