Abstract (en)
[origin: WO2008148408A1] The invention relates to a ventilation strip with at least two side strips running parallel to each other and a center strip. The ventilation strips run parallel to the side strips and are formed by circular walls or webs connected to each other. The ventilation strips can also have the most varied shapes. At least one duct is provided; however, it is also possible to provide a plurality of ducts. By the use of certain materials for the ventilation strip which have restorative forces, the at least one duct can open by itself when the ventilation strip is rolled out. However, it is also possible to effect an opening of the at least one duct by pulling on the side strips.
