Abstract (en)
[origin: EP2154465A2] The exchanger (1) has bowl-like plates (3) parallel stacked one above the other and stretching flow areas of two media. A connecting element (6) retains a support (13) in an area of an end plate (5). The support is arranged at a section (7) of the connecting element, where the section protrudes with respect to the bowl-like plates. The support is fastened to a connecting plate in an area of an opening on a side of the connecting element, where the side is turned to the bowl-like plates. The element has a channel part that is formed as a deformed sheet metal or forging part or a casting part.
