Abstract (en)

[origin: WO2008145518A1] The invention relates to a domestic appliance for treating items of laundry with a dryer part (1) which can be cooled by cooling air (K) and comprises a condenser which comprises a hollow body (2) through which damp process air (P) which comprises lint can flow substantially upward from below and through which condensate liquid (22) can flow downward from above, wherein the hollow body (2) has a constriction (24) which is formed so as to prevent condensate liquid (22) running down the inner walls (21) of the hollow body (2) from running down in an unobstructed manner under the action of the process air (P) flowing in the opposite direction by approximately cylindric eddying (23), wherein a lint filter system is formed by means of the interaction between the eddying (23) and the flowing process air (P).
