Abstract (en)
   [origin: WO2008138029A1] A detection filter installed in an application server including a secure application. The filter includes a rules engine for receiving request data representing an access request for the secure application from a user. The engine applies at least one risk condition rule to the request data to generate a risk probability level, and detects at least one fraud condition when the risk probability level exceeds a threshold level, before passing the access request to the secure application.
