Abstract (en)  
The device has rollers (13), and a conveyor chain by which fuel parts e.g. wood parts, are upwardly transported to an outlet duct (8), where the fuel parts are supplied to a boiler. A compensator (4) is provided at a base, and upwardly moved with a lifting motor (3) during emptying so that rest of the fuel parts slides into an actuator of the conveyor chain. The conveyor chain is moved by a drive motor (7) about height of the actuator. The fuel parts are fell into outlet duct before a flap (9) that is opened by a servomotor.
