Abstract (en)
[origin: CA2687506A1] The invention relates to an electronic system comprising a casing consist ing of at least first and second casing portions and containing a device for detecting the substitution of the first casing portion. The device comprise s a first integrated circuit intended to be fixed to the first casing portio n and a second integrated circuit intended to be fixed to the second casing portion. The second circuit is adapted to transmit to the first integrated c ircuit successive random or pseudo-random digital signals (R). The first int egrated circuit is adapted to return to the second integrated circuit, for e ach digital signal, a first encrypted signature (S) from said digital signal . The second integrated circuit is adapted to determine a second encrypted s ignature (S') from said digital signal and to detect a substitution of the f irst casing portion if the first and second encrypted signatures are differe nt.
