Abstract (en)

With a packaging having a container (10) and a lid (20) peelably sealed onto a flat sealing shoulder (18) of a circumferential container rim (16), an indentation (24) is formed in a portion (22) of the sealing shoulder (18) thereby creating a cavity (26) covered by the lid (20), which cavity (26), after having cut through along a given cut line (28), is providing a grip portion (32) of the lid (20) as a tear tab for peeling the lid (20) from the sealing shoulder (18). This lid system is a valuable protection against unauthorized opening and is effective in restraining unauthorized persons to manually open the package without using a tool.
