Abstract (en)
[origin: EP2161193A2] The device has a locking device for locking a fluidic connection unit e.g. valve seat carrier (2), on a diaphragm-operated valve (1) via a threaded end (12) and a cylindrical bore (103) of the valve. The locking device is formed by rings (6, 8), spring (7) and housing (9). The device is displaceable and/or deformable between a locking configuration, in which the movement between the valve and the unit is limited for preventing disintegration of the end and the bore, and an unlocking configuration, in which the movement is authorized for disintegrating the end and the bore.
