Abstract (en)

[origin: EP2015011A1] The method involves monitoring an operation for those users of a refrigerant compressor component (4) which represent a two-digit percentage of the total load on the refrigerant compressor component. A total instantaneously available negative load reserve is calculated. A predetermined turbine (10) is switched off when the load reserve reaches by a frequency regulation of the one or more refrigerant compressors (7) is lower than the energy demand of the largest of the refrigerant compressors.
