Abstract (en)

[origin: WO2009000631A1] The invention describes a method for encoding multimedia data (MM), in which a data aggregate (F) comprising the multimedia data (MM) is formed from a number of mutually independent fragments (FR<sub>n-1</sub>, FR<sub>n</sub>, FR<sub>n+1</sub>). Each of the number of fragments is assigned a respective explicit identifier (ID) for identifying the respective fragment, wherein the identifier (ID) is stored in a respective metadata structure (MDD) associated with the fragment. A respective metadata structure (MDD) is used to store the identifiers (ID) for a first, in particular chronologically preceding, and/or a second, in particular chronologically succeeding, fragment (PreID, SucID).
