Abstract (en)
[origin: WO2008155470A1] Device for adjusting the slope of the seat base of a seat with respect to a means of support of said seat base mounted on top of the seat leg. This device comprises: a shell supporting the padded part of the seat base, rotatable with respect to the means of support about a transverse axis located towards the front of the shell; a system comprising at least one cam suitable for moving the seat base shell with respect to the means of support between a first or approximately horizontal position and a second or inclined position; and control means for the cam system.
