Abstract (en)
[origin: WO2008147091A1] Provided is a transporter having a board base plate, a propulsion unit mounted to the board base plate to be in propulsion motion, a steering unit mounted to the board base plate to control a direction, a microprocessor controlling the propulsion unit and the steering unit, a power source unit supplying power, a board upper plate spaced a predetermined gap from an upper portion of the board base plate, the board upper plate being vertically movable according to a load applied by a driver riding thereon, and a plurality of sensors respectively disposed on a front side, a rear side, a left side, and a right side between the board base plate and the board upper plate and sensing a vertical movement of the board upper plate to respectively output signal values corresponding to the vertical movement. The microprocessor receives the signal values and controls speed and direction based on the signal values. Thus, the driver changes each portion to which his/her weight is applied, to control the speed and direction without using a separate manual controlling device.
